Professional Summary

Dr. Whitton's research aims to better understand modern couples and families and to help them build and maintain the types of strong, stable relationships that promote health and well-being. She is particularly interested in understudied and marginalized groups, including sexual and gender minorities. Dr. Whitton conducts basic research to identify factors that promote strong relationships in the face of adversity, and uses the findings to develop couple-based interventions to promote individual, couple, and family health. Grant #R01HD086170 Whitton, Sarah 04/01/2016 03/31/2021 National Institute of Child Health and Human Development Intimate Partner Violence in Sexual Minority Female Adolescents and Young Adults Role:PI $584,191.00 Active National 16SS
Grant #1 R01 HD086170-01A1 Whitton, Sarah W. 04/01/2016 03/31/2021 National Institute of Child and Human Development Intimate Partner Violence in Sexual Minority Female Adolescents and Young Adults Role:PI 3,225,869 Active Grant National Young female sexual minorities (YFSM) are at exceptionally high risk for intimate partner violence (IPV), with over half of YFSM reporting physical or sexual abuse by a dating partner. These young IPV victims may be particularly vulnerable to the negative physical and mental health consequences of IPV, including substance abuse, depression, and suicide, due to minority stress and diminished protective resources (e.g., parent support, community connectedness). In addition, YFSM may be less likely to report and to seek or receive help for IPV because they are not "out" about their sexual orientation or they fear stigmatization and discrimination. Women who seek help for same-sex IPV are often denied services (e.g., two-thirds of LGBT IPV survivors were denied access to domestic violence shelters) and feel marginalized and unsupported by domestic violence service systems. Basic research is clearly needed to inform development of culturally sensitive, evidence-based interventions to prevent IPV in YFSM and to support female sexual minority IPV victims. The existing literature, however, has almost exclusively focused on IPV in heterosexuals. Because LGBT teens and young adults face unique issues surrounding their relationships and sexual behaviors (e.g., pressures to deny or conceal sexual identity and activities), the risk and protective factors for IPV, help-seeking behaviors, and consequences of IPV in sexual minority youth are likely quite different from those observed in heterosexual youth. The overarching goal of this project is to begin to address these disparities by conducting an innovative study of IPV in female sexual minority adolescents and young adults (YFSM). We propose a novel, minority stress-informed dynamic developmental systems perspective of IPV in YFSM, which we will test using a mixed-methods, accelerated longitudinal design. Building upon the longest running study of LGBT youth, we will collect quantitative data from two ethnically diverse cohorts of YFSM (N=530; ages 16-26) every six months for two years, as well as qualitative data from 50 selected participants. We will accomplish the overarching goal with four primary specific aims: (1) Describe the nature and trajectories of IPV in YFSM across adolescence and young adulthood; (2) Identify risk and protective factors for IPV among YFSM, including factors that differentiate violent vs. non-violent/healthy relationships; (3) Examine factors that affect YFSM's reporting of IPV, help-seeking for IPV, and ability to benefit from help provided (e.g., cultural competence of providers); and (4) Evaluate the consequences of IPV in YFSM, identifying factors that raise risk for or protect YFSM victims from revictimization and negative health consequences of IPV. Integration of the resulting quantitative and qualitative data will be used to inform the development of evidence-based interventions to prevent IPV among YFSM and better serve those who experience IPV. 16SS Major Goal:To examine intimate partner violence (IPV) in young female sexual minority adolescents and young adults.

Grant #15GRNT25740030 Whitton, Sarah; Mcleish, Alison 07/01/2015 06/30/2017 American Heart Association - Great Rivers Affiliate Augmenting Smoking Cessation Treatment with Relationship Education Role:PI $153,979.00 Active Grant National Despite the negative health effects of smoking, nearly 20% of U.S. adults are smokers. Although many smokers are interested in quitting, 75% of those who participate in smoking cessation treatment programs relapse within one month. Poor social support for quitting, especially from romantic partners, is an important risk factor for unsuccessful quit attempts. Our study aims to determine if we can improve the effectiveness of smoking cessation treatment by including smokers' partners and adding couple relationship education to improve partner support for quitting. Our new Partner-Assisted Cessation Treatment (PACT) was developed to improve standard smoking cessation treatment by adding couple relationship education strategies that are known to improve couple support and communication. In this project, we aim to determine if the new couples-based program (PACT) is feasible to deliver, acceptable to smokers and their partners, effective in improving the couple support processes that are known to predict positive smoking cessation outcomes (specifically, the help-seeking communication behavior of smokers, support provision of partners, and couple problem-solving skills), and effective in improving cessation rates. 15SS Percent Effort:8 Major Goal:Evaluate the feasibility, acceptability, and efficacy of a new partner-based smoking cessation program (PACT).
