RESEARCH

BRIEF RESEARCH STATEMENT

My research lies at the intersection of biomedical informatics and human-centered computing, where I leverage the medical sciences, social/cognitive sciences, human factors, and usability science to develop, test, and clinically study the effects of digital health solutions with targeted patient populations, particularly, cancer, dementia, and stroke. My formative education, coupled with acquired cross-disciplinary knowledge and research methods, has enabled me to map a progressive line of inquiry with increasing focus and innovation. Since 2006, the aim of my translational research has been to generate new knowledge and novel digital health interventions that have a direct impact on the diagnostic and therapeutic treatment of patients with a range of diseases. **In sum, my current research falls within the broader domains of (1) Digital Health Solutions and (2) Health Behavior.**

Digital health, as my primary research focus, includes three emerging health information technologies (HIT) with their respective patient populations and interdisciplinary methods. This research includes collaboration with physicians, nurses, biomedical and mechanical engineers, biochemists, biomedical informaticians, and medical researchers who share my passion and focus on several diseases and health conditions. The three HITs include: Virtual/Mixed Reality Therapeutic Medicine (VRx), Diagnostic Biosensors, and Mobile Health (mHealth).

See my extended Research Statement for details, including current and forthcoming projects and funding.

- ⁹ This NSF funded research addresses the global epidemic of diabetes mellitus types 1 and 2, as well as related physiological complications stemming from severe hypoglycemia (HYPO). HYPO detection relies on analyzing blood glucose levels through continuous monitoring, saliva, urine, and skin pricking—all of which have limited accuracy. Diabetes-alert dogs (DADs) are trained to detect HYPO by smelling volatile organic compounds (VOCs) in human breath. Patients with DADs have demonstrated more accurate and faster detection than those methods noted. In this research, we developed a HYPO warning and data delivery system, referred to as HYPOalert that uses a nanosensor that mimics a canine's ability to detect HYPO from VOCs in human breath. The sensor outputs data integers from 1 to 10 (via Bluetooth) to a smartphone app, which provides numeric and data visualizations along with HYPO alerts that warn patients when they are approaching or in HYPO. Three prototype iterations have been completed and tested.
